Converting inaccessible mathematical expressions using EquatIO

Last Modified on 12/06/2022 3:13 pm CST

Every image on a computer application has an alternative text attached to it. Alternative text descriptions of images (*alt text*) are used by screen readers, such as **Read Speaker** and **Read and Write**, to convey the image information to the users. Mathematical formulas and expressions are displayed as images in D2L and other applications. Several image formats can be used, the most common is .png. The *alt text* of the image must contain a description of the mathematical expression. For example, the mathematical formula " $y=x^2+4$ " *alt text* should be (y equals x squared plus 4). These are the instructions on how to access the *alt text* of an image in the D2L Editor:

1. Select an image (a blue rectangle with blue squares on the corners will appear), then Rightclick on the image. Select **[Image...]**.

2. View the alternative text generated.

An **inaccessible mathematical formula** is a mathematical formula that contains a null or wrong *alt text*. Using the EquatIO Screenshot tool it is possible to generate a new mathematical formula image with the adequate alt text to replace this inaccessible image.

- 1. First open D2L Editor where the inaccessible image is placed.
- Open Google Chrome EquatIO Extension located on the Google Chrome toolbar EquatIO shortcut button (
) or under the extension button(
).
